                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          -1- SUBUNIT: Synthesized as a single chain precursor, which is cleaved into a light chain and a heavy chain held together by a disulfide bond. The enzyme is then activated by thromblin, which cleaves a tetradecapeptide from the amino end of the heavy chain; this reaction, which occurs at the surface of endothelial cells, is strongly promoted by thrombomodalin.
-1- TISSUE SPECIFICITY: Plasma; synthesized in the liver.
-1- FTM: The vitamin K-dependent, enzymatic carboxylation of some Glu residues allows the modified protein to bind calcium.
-1- FTM: The vitamin K-dependent, with stronger affinity to another site, beyond the GlA domain. This GLA-independent binding thrombomodulin complex.
-1- SIMILARITY: Eslorgs to peptidase family S1.
-1- SIMILARITY: Contains 2 EGF-like domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This SWISS-PROT entry is copyright. -!- SUBUNIT: Synthesized as a single chain precursor, which is cleaved into a light chain and a heavy chain held together by a disulfide bond. The enzyme is then activated by thrombin, which cleaves a tetradecapeptide from the activated by thrombin, which cleaves a terradecapeptide from the activated by thrombin, this reaction, which occurs at the surface of endothelial cells, is strongly promoted by thrombomcdulin.

-!- ISUB SPECIFICITY: Plasma, synthesized in the liver.
-!- PTM: The vitamin K-dependent, enzymatic carboxylation of some Glu residues allows the modified procein to bind calcium.

-!- PTM: The vitamin K-dependent, enzymatic carboxylation of some Glu residues allows the modified procein to bind calcium.

-!- PTM: The vitamin K-dependent, enzymatic carboxylation of some Glu stesidues allows the modified procein to bind calcium.

-!- PTM: The vitamin K-dependent, enzymatic carboxylation of some Glu sessitum also binds, with stronger affinity to another site, beyond the Gla domain. This Gla-independent binding thrombomcdulin complex to peptidase family SI.

-!- SIMILARITY: Contains 2 EGF-like domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This SWISS-PROT entry is copyright. The enzyme is then activated by thromblin, which cleaves a tetradecapeptide from the amino end of the heavy chain; this reaction, which occurs at the surface of endothelial cells, is strongly promoned by thrombomodulin.
-!- TISSUE SPECIFICITY: Plana,: synthesized in the liver.
-!- PTM: The vitamin K-dependent, enzymatic carboxylation of some Glu residues allows the modified protein to bind calcium.
-!- PTM: another site, beyond the GLA domain. This GLA-independent binding site is necessary for the recognition of the thrombin-thrombomodulin complex.
-!- SIMILARITY: Contains 2 EGF-like domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This SWISS-PROT entry is copyright. -!- FUNCTION: Protein C is a vitamin K-dependent serine protease that regulates blood coagulation by inactivating factors Va and VIIIa in the presence of calcium ions and phospholigids.
-!- CATALYTIC ACTIVITY: Degradation of blood coagulation factors Va and VIIIa.

The enzyme is then activated by thrombin, which oleaves a terradecapeptide from the amino end of the heavy chain; this reaction, which occurs at the surface of endothelial cells, is strongly promoted by thrombomodulin.

-1- TISSUE SPECIFICITY: Plasma; synthesized in the liver.
-1- PTM: The vitamin K-dependent, enzymatic carboxylation of some Glu residues allows the modified protein to bind calcium.
-1- MISCELLANEOUS: Calcium also binds, with stronger affinity to another site, beyond the GLA domain. This GLA-independent binding site is necessary for the recognition of the thrombin-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cell. Mol. Life Sci. 58:148-159(2001).
-!- FUNCTION: Protein C is a vitamin K-dependent serine protease that regulates blood coagulation by inactivating factors Va and VIIIa in the presence of calcium ions and phospholipids.
-!- CATALYTIC ACTIVITY: Degradation of blood coagulation factors Va

                                                                                                                              The relative orientation of Gla and EGF domains in coagulation factor X is altered by Ca2+ binding to the first EGF domain. A combined NMR-small angle X-ray scattering study.";

E slochemistry 35:11547-11559(1996).

-!- FUNCTION: Factor Xa is a vitamin K-dependent glycoprotein that converts prothrombin to thrombin in the presence of factor Va, calcium and phospholipid during blood clotting.

-!- FUNCTION: Pactor Xa is a vitamin K-dependent glycoprotein that calcium and phospholipid during blood clotting.

-!- FUNCTION: Pactor Xa is a vitamin K-dependent by closur thrombin.

-!- FUNCTION: Preferential cleavage: Arg-|-Thr and then Arg-|-II-bonds in prothrombin to form thrombin.

-!- SUBUNIT: The two chains are formed from a single-chain precursor by the excision of two Arg residues and are held together by 1 or more disulfide bonds.

-!- FUN: The vitamin K-dependent, enzymatic carboxylation of some glutamate residues allows the modified protein to bind calcium.

-!- FUN: A and O-glycosylated.

-!- FUN: The ACTIVATION PEPTIDE IS CLEAVED BY FACTOR IXA (IN THE INTRINSIC PATHWAY).

-!- FUN: NESELLANEOUS: Calcium also binds, with stronger affinity to another site, beyond the GLA domain.

-!- SIMILARITY: Belongs to peptidase family S1.
like domain in coagulation factor X.";

Genet. 23:373-373(1999).

Nat. Genet. 23:373-373(1999).

-! FUNCTION: Factor Xa is a vitamin K-dependent glycoprotein that converts prothrombin to thrombin in the presence of factor Va, calcium and phospholishid during blood clotting.

-! CATALYTICA CTIVITY: Preferential cleavage: Arg-|-Thr and then Arg-|-Ile bonds in prothrombin to form thrombin.

-! SUBUNIT: The two chains are formed from a single-chain precursor by the excision of two Arg residues and are held together by 1 or more disulfide bonds.

-! TISSUE SPECIFICITY: Plasma; synthesized in the liver.

-! PTM: The vitamin K-dependent, enzymatic carboxylation of some glutamate residues allows the modified protein to bind calcium.

-! PTM: N- and O-Glycosylated.

-! PTM: N- and O-Glycosylated.

-! PTM: THE ACTIVATION PEPTIDE IS CLEAVED BY FACTOR IXA (IN THE INTRINSIC PATHWAY).

-! SIMILARITY: Belongs to peptidase family S1.
                                                                                                                                                                                 "Characterization of single-nucleotide polymorphisms in coding regions

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Thromb. Res. 85:503-514 (1937).
-!- FUNCTION: Rector Xa is a vitamin K-dependent glycoprotein that converts prothrombin to thrombin in the presence of factor Va, calcium and phospholipid during blood clotting.
-!- CATALYTIC ACTIVITY: Preferential cleavage: Arg-|-Thr and then Arg-|-Ih bonds in prothrombin to form thrombin.
-!- SUBGNAT: The two chains are formed from a single-chain precursor by the excision of two Arg residues and are held together by 1 or

- !- FUNCTION: THROMBIN, WHITH CLEAVES BONDS AFTER RG & LVS, CONVERTS

C. - CATALITOR: THROMBON, WHITH CLEAVES BONDS AFTER RG & LVS, CONVERTS

FIRRINGERN TO FIBRIN AND ACTIVATES RACTORS V, VII, VIII, XIII,

AND, IN COMPLEX WITH THROMBONDULIN, PROTEIN C.

- CATALITIC ACTIVITY: Preferential cleavage: Arg-1-Gly; activates

fibringen to fibrin and releases fibrinopeptide A and B.

- - PTM: THE GAMMA-CARBOXYLLATION OF GLUTAMYL RESIDUES WA MICROSOMAL

C. - PTM: THE GAMMA-CARBOXYLLATION OF GLUTAMYL RESIDUES WA MICROSOMAL

ERSULT FROM THE CARBOXYLLATION OF GLUTAMYL RESIDUES BY A MICROSOMAL

C. - PTM: THE GAMMA-CARBOX GLUTAMYL RESIDUES, WHICH IS ESSENTIAL FOR THE CONVERSION

C. - PROTHROMBIN TO THROMBIN.

C. - PROTHROMBIN TO THROMBIN.

C. - MISCELLANEOUS: PROTHROMBIN IS ACTIVATED ON THE SURFACE OF A

PHOSPHOLIPID MEMBRANE THAT BINDS THE AMINO END OF PROTHROMBIN &

C. PACTORS VA & AX AN IN CA-DEPRINENT INTERACTIONS; PACTOR XA REMOUSES

THE ACTIVATION PREPIDE & CLEAVES THE REMAINING PART INTO LIGHT &

HEAVY CHAINS: THE ACTIVATED BY THE INITIAL, SMALL AMOUNTS OF

THOMBAND
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This SWISS-PROT entry is copyright. SEQUENCE OF 384-618 FROM N.A.

of thrombin.
MISCELLANEGUS: Thrombin can itself cleave the amino terminal fragment (fragment 1) of the prothrombin, prior to its activation by factor Xa.

This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation the European Bioinformatics Institute. There are no restrictions on its SIMILARITY: Belongs to peptidase family S1. SIMILARITY: Contains 2 kringle domains.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 19,

Sequence 20, Application US/08955636A

Patent No. 6017882

GENERAL INFORMATION:
APPLICANT: Nelsestuen, Gary
TITLE OF INVENTION: MODIFIED VITAMIN K-DEPENDENT
TITLE OF INVENTION: POLYPEPTIDES
FILE REFERENCE: 09531/002001
CURRENT APPLICATION NUMBER: US/08/955,636A

CURRENT FILING DATE: 1997-10-23

NUMBER OF SEQ ID NOS: 35

GENERAL INFORMATION:
APPLICANT: Griffin, John H.
APPLICANT: Mesters, Rolf M.
TITLE OF INVENTION: Serie Protease-Derived Polypeptides and
TITLE OF INVENTION: Anti-Peptide Antibodies, Systems and Therapeutic Methods
TITLE OF INVENTION: for Inhibiting Coagulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              OTHER INFORMATION: /note= "partial sequence of human protein C"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ch 86.9%; Score 172; DB 2; Length 45; 1. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 5, Sequence 5, Sequence 3, Sequence 1, Sequence 2, Sequen

Vitamin K-dependent polypeptide with modified gamma-carboxyglutamic acid domain, useful for treating clotting disorders.

Claim 9, Page 79, 86pp, English.

This sequence represents a modified GLA (gamma-carboxyglutamic acid) domain. The invention relates to a vitamin K-dependent polypeptide comprising a modified GLA domain containing an amino acid substitution which enhances membrane binding of the modified polypeptide as compared to the native polypeptide. The polypeptide is used to treat a clotting disorder by decreasing or increasing clot formation. Modification of the affinity as compared to the native protein

The present sequence is that of a claimed human protein C derivative in which His at position 10 of the marure wild-type protein C sequence (see AABS273) is substituted with Glu, Ser at position 11 with Glu, at position 32 with Glu, Asn at position 33 with Asp, and Leu at position 194 with Ser. It is an example of protein C derivatives of the invention thave at least 2 amino acid substitutions, but which have increased anticoagulant activity and resistance to inactivation by serpins compared with the wild-type protein, while retaining the biological activity of the wild-type protein. A method of producing the derivatives using recombinant DNA methods is claimed. The protein C derivatives are useful for treating coronary syndromes and disease states predisposing to cromary syndromes and disease states predisposing to thrombosis (e.g. mycocardial infarction and unstable angina), vascular occlusive disorders and hypercoagulable states, sepsis (in combination with bactericidal permeability increasing protein or with tissue factor pathway inhibitor), thrombotic disorders (in coronary catherer), protein C deficiency, acute arterial thrombotic occlusion, proteins of active arterial thrombotic coclusion, thrombotic disorders in coronary, cerebral or peripheral arteries or in vascular grafts. Human patients with genetically predisposed prothrombotic disorders with genetically predisposed prothrombotic disorders with genetically predisposed prothrombotic disorders with genetically predisposed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    treating, e.g., myocardial thrombotic disorders, acute arterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The present sequence is that of a claimed human protein C derivative in which His at position 10 of the wild-type protein C sequence (see AABS2673) is substituted with Glu, Ser at position 13 with Gly, Glu at position 33 with Asp, Leu at position 194 with Ser, and Thr at position 254 with Ser. It is an example of protein C derivatives of the invention that have at least 2 amino acid derivatives of the invention that have an example of protein C derivatives of the wild-type are sistance to inactivation by serpins compared with the wild-type protein, while retaining the biological activity of the wild-type protein. While retaining the biological activity of the wild-type protein. The protein of derivatives are useful for treating methods is claimed. The protein of derivatives are useful for treating coronary syndromes and disease states predisposing to thrombosis (e.g. myocardial infarction and unstable angula), vascular occlusive disorders and hypercoagulable states, sepsis (in combination with bactericidal thrombotic disorders (in combination with an anti-platelet agent to by local delivery through an intracoronary catheter), protein C deficiency, acute arterial thrombotic occlusion, thromboembolism, or stenosis in coronary, cerebral or peripheral arteries or in vascular graffs. Human patients with genetically predisposed prothrombotic disorders may be treated by gene therapy (all claimed)
                                                                                                                                                                                                                                                                                                               Novel human protein C derivative for treating, e.g., myocardial infarction, unstable angina, sepsis, thrombotic disorders, acute arterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; protein C derivative; anticoagulation activity; thrombosis; serpin inactivation; acute coronary syndrome; myocardial infarction; vascular occlusive disorder; hypercoagulable state; angina; sepsis; disseminated intravascular coagulation; DIC; burn; transplantation; sickle cell disease; viral haemorrhagic fever; protein C deficiency; haemolytic uremic syndrome; acute arterial thrombotic occlusion; thromboembolism; prothrombotic disorder; gene therapy; thalassaemia.

Vitamin K-dependent polypeptide with modified gamma-carboxyglutamic acid domain, useful for treating clotting disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a modified GLA (gamma-carboxyglutamic acid) domain. The invention relates to a vitamin K-dependent polypeptide comprising a modified GLA domain containing an amino acid substitution which enhances membrane binding of the modified polypeptide as compared disorder by decreasing or increasing of the containing of the containing of the containing of the containing of the modification. Modification of the GLA domain results in a protein which has enhanced membrane binding affinity as compared to the native protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Protein C; human, coronary syndrome; thrombosis; angina; myccardial infarction; vascular occlusive disorder; hypercoagulation; sepsis; protein C deficiency; occlusion; thromboembolism; stenosis; antibacterial; immunosuppressive; thrombolytic; cardiant; antianginal; anticoagulant; therapy; mutant; mutein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to human protein C derivatives and nucleic acid
molecules encoding such derivatives. These derivatives have increased
anticoappllation activity, resistance to serpin inactivation and increased
sensitivity to thrombin activation compared to wild type protein C, and
retains the biological activity of the wild type human protein C, and
certains the biological activity of the wild type human protein C, and
certains the biological activity of the wild type human protein C, and
certains the biological activity of the wild type human protein C. and
certains the biological activity of the wild type human protein C. Protein
certains the biological activity of the wild type human for the
certains are useful in the manufacture of a medicament for the
certains and disease states predisposing to thrombosis, vascular
certains and hypercoagulable states e.g. disseminated
coclusions, tablassamena,
sickle cell disease, viral haemorrhagic fever and haemolytic uremic
syndrome; sepsis in combination with bacterial permeability increasing
protein; thrombotic disorders in combination with an anti-platelet agent;
corin vascular graffs in combination with a thrombotic agent. Nucleic
corin wascular graffs in combination with a thrombotytic agent. Nucleic
corin wascular graffs in combination with a thrombotytic agent. Nucleic
corin molecules of the invention are useful for treating humans with
correspond to present sequence is human protein C derivative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                        Protein C derivative for treating acute coronary syndromes, vascular occlusive disorders, thrombotic disorders and sepsis, comprises substitutions at specified amino acid positions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

It is an example of protein C derivatives of the invention that have at least 2 amino acid substitutions, but which have increased anticoagulant activity and resistance to inactivation by serpins compared with the wild-type protein, while retaining the biological activity of the wild-type protein. A method of producing the derivatives using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      arterial

                for treating coronary syndromes and disease states predisposing to thrombosis (e.g. myocardial infarction and unstable angina), vascular coclusive disorders and hypercoagulable states, sepsis (in combination with bactericidal permeability increasing protein or with tissue factor pathway inhibitor), thrombotic disorders (in combination with an antipathelet agent or by local delivery through an intracoronary catheter), protein C deficiency, acute arterial thrombotic occlusion, thrombotism, or stenosis in coronary, cerebral or peripheral arteries or in vascular grafts. Human patients with genetically predisposed prothrombotic disorders may be treated by gene therapy (all claimed)
     The protein C derivatives are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  myocardial infarction; vascular occlusive disorder; hypercoagulation; sepsis, protein C deficiency; occlusion; thromboembolism; stenosis; antibacterial; immunosuppressive; thrombolytic; cardiant; antianginal; anticoagulant; therapy; mutant; mutein.

The present sequence is that of a claimed human protein C derivative in which Ser at amino acid position 11 of the mature wild-type protein C sequence (see AAB8253) is substituted with Gly, Gln at position 32 with Glu, Asn at position 33 with Asp, and Leu at position 194 with Ser. The protein is an example of protein C derivatives of the invention that have at least 2 amino acid substitutions, but which have increased anticoagulant activity and resistance to inactivation by serpins compared with the wild-type protein, while retaining the biological activity of the wild-type protein. A method of producing the derivatives using recombinant DNA methods is claimed. The protein C derivatives using the creating coronary syndromes and disease states predisposing to thrombosis (e.g. myocardial infarction and unstable angina), vascular occlusive disorders and hypercoagulable states, sepsis (in combination with bactericidal permeability increasing protein or with tissue factor pathway inhibitor), thrombotic disorders (in combination with an antipercent C deficiency, acute arterial thrombotic occlusion, protein combination with an antipercent C deficiency, acute arterial thrombotic occlusion, protein combination with an antipercent C deficiency, acute arterial thrombotic occlusion, arterial arterial thrombotic occlusion. thromboembolism, or stenosis in coronary, cerebral or peripheral arteries or in vascular grafts. Human patients with genetically predisposed prothrombotic disorders may be treated by gene therapy (all claimed)

Protein C derivative for treating acute coronary syndromes, vascular occlusive disorders, thrombotic disorders and sepsis, comprises substitutions at specified amino acid positions.

Claim 4; Page 47-48; 59pp; English

The invention relates to human protein C derivatives and nucleic acid molecules encoding such derivatives. These derivatives have increased anticoagulation activity, resistance to serpin inactivation and increased canticoagulation activity of the wild type protein C, and retains the biological activity of the wild type human protein C, and carturatives are useful in the manufacture of a medicament for the treatment of acute coronary syndromes e.g. myocardial infarction and unstable angina; and disease states predisposing to thrombosis; vascular intravascular coagulation (DIC), burns, transplantations, thalassaemia, sickle cell disease, viral haemorrhagic fever and haemolytic uremic syndrome; sepsis in combination with bacterial permeability increasing sickle cell disease, viral haemorrhagic fever and nami-platelet agent; protein; thrombotic disorders in combination with an anti-platelet agent; protein C deficiency; acute arterial thrombocic occlusion; thrombotendism or stenosis in coronary, cerebral or periphefal arteries or in vascular grafts in combination with a thrombolytic agent. Nucleic acid molecules of the invention are useful for treating humans with.

Second molecules of the invention are useful for treating humans with present sequence is human protein C derivative

Claim 3; Page 46-47; 59pp; English,

Protein C derivative for treating acute coronary syndromes, vascular occlusive disorders, thrombotic disorders and sepsis, comprises substitutions at specified amino acid positions.

The invention relates to human protein C derivatives and nucleic acid molecules encoding such derivatives. These derivatives have increased anticoagulation activity, resistance to serpin inactivation and increased sensitivity to thrombin activation compared to wild type protein C, and retains the biological activity of the wild type human protein C, and retains the biological activity of the wild type human protein C, and retains the biological activity of the wild type human protein C, and retains the biological activity of the wild type human protein C. Protein C derivatives are useful in the manufacture of a medicament for the treatment of acute occupanty syndromes e.g. myocardial infarction and unstable angina; and disease states predisposing to thrombosis; vascular occupation (DIC), burns, transplantations, thalassaemia, sickle cell disease, viral haemorrhagic fever and haemolytic uremic sickle cell disease, viral haemorrhagic fever and haemolytic uremic protein; thrombotic disorders in combination with bacterial permeability increasing protein; thrombotic disorders in combination with a nati-platelet agent; thrombotic manufacture arterial thrombotic occlusion.

Thrombotules of the invention are useful for treating humans with research examinated in human protein disorders by gene therapy. The present sequence is human protein C derivative

The invention relates to a vitamin K-dependent polypeptide comprising a modified GLA domain containing an amino acid substitution which enhances membrane binding of the modified polypeptide as compared to the native polypeptide. The polypeptide is used to treat a clotting disorder by decreasing or increasing clot formation. Modification of the GLA domain results in a protein which has enhanced membrane binding affinity as compared to the native protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Vitamin K-dependent polypeptide with modified gamma-carboxyglutamic acid domain, useful for treating clotting disorders.

Vitamin K-dependent polypeptide with modified gamma-carboxyglutamic acid domain, useful for treating clotting disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        domain. The invention relates to a vitamin K-dependent polypeptide comprising a modified GLA domain containing an amino acid substitution which enhances membrane binding of the modified polypeptide as compared to the native polypeptide. The polypeptide is used to treat a clotting disorder by decreasing or increasing clot formation. Modification of the affinity as compared to the native protein which has enhanced membrane binding affinity as compared to the native protein

This sequence represents a modified GLA (gamma-carboxyglutamic acid) domain. The invention relates to a vitamin K-dependent polypeptide comprising a modified GLA domain containing an amino acid substitution which enhances membrane binding of the modified polypeptide as compared tio the native polypeptide. The polypeptide is used to treat a clotting disorder by decreasing or increasing clot formation. Modification of the affinity as compared to the native protein which has enhanced membrane binding affinity as compared to the native protein
                                                                                Vitamin K-dependent polypeptide with modified gamma-carboxyglutamic acid domain, useful for treating clotting disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Protein C; Gla domain; human; blood clotting; anticoagulant; thrombolytic; antiarteriosclerotic; cardiant; antiaggregant; mutant;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New variant blood coagulation component, useful for manufacturing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          medicament for treating or preventing coagulation disorders, e.g. thrombosis, comprises an anticoagulant activity in the protein Canticoagulant system of blood.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /note= "wild-type His substituted by Gln"

                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents a modified GLA (gamma-carboxyglutamic acid) domain. The invention relates to a vitamin K-dependent polypeptide comprising a modified GLA domain containing an amino acid substitution which enhances membrane binding of the modified polypeptide as compared to the native polypeptide. The polypeptide is used to treat a clotting disorder by decreasing or increasing clot formation. Modification of the affinity as compared to the native protein which has enhanced membrane binding affinity as compared to the native protein
                                                                                                                                                                                                                                                                                                                     Vitamin K-dependent polypeptide with modified gamma-carboxyglutamic acid domain, useful for treating clotting disorders.

Example 1; Page; 58pp; English

The present sequence is the protein sequence of a mutated Gla domain (N-terminal amino acids 1-45) of human protein C. The mutated Gla domain contains the substitution mutations H100, S116 and S12N. Protein C and activated protein C variants comparising a mutated Gla domain are provided by the invention. The variants contain at least 6, and optionally 7-10, amino acid substitutions. A preferred mutant (designated GQNSEDY, see ABB19946) has the mutations H100, S116, S12N, D23S, Q32E, N33D and H44Y, and shows greatly enhanced anticoagulant activity in standard in vitro coagulation assays. The present mutant (designated QGNSEDY, see nexample from the invention as a step toward the production of the QGNSEDY mutant Gla domain, and shows little, if any, improvement in provides methods for producing the variants based on DNA technology, and with the use of the variants for the treatment of coagulation disorders such as thrombosis or APC resistance, or in diagnostic test systems for assaying components of the protein C-anticoagulant system (all claimed). The variants may also be used in treating arteriosclerosis, myocardial infarction, and disseminated intravascular coagulation. Note: The present sequence is not shown in the specification but is derived from the human wild-type Gla domain sequence given on page 7 of the specification (see ABB79947)
